

SRNSLCEX – National Student Clearinghouse –Report

Logic –

The program starts Init-Report which gets the current date, gets the institution setup info for NSLC, gets the academic term field based on the academic stats period. Then it prints off the header. Then it performs the build where clause where it checks if the students are all graduates and if there is branch code info. Then it opens the NSLC Extract File. At this point the program reads the student consolidated stats table and writes the NSLC detail records. Then it writes the NSLC file trailer record. During this the program checks for valid institutions, if the output file can be opened, if the header can be written, and if there's been a detail write error. If any of these can't be done the program won't continue. At this point the program is done.
